## I. EVIDENCE DESCRIPTION

An iPhone 13 Pro was recovered from the suspect's vehicle (centre console) during a secondary search at 14:20 UTC. The device was found powered on in 'Airplane Mode'. To prevent remote wiping or GPS tracking, the device was immediately placed into a Signal-Shielding Faraday Bag (Serial: FB-8829). Physical condition: Minor screen crack on the bottom-right corner.

## II. FORENSIC TOOLS & ENVIRONMENT

- Cellebrite UFED 4PC: For high-level mobile data extraction and bypassing screen locks.
- MSAB Raven: Used for field-triage of mobile application data.
- Magnet AXIOM Cyber: To reconstruct deleted chat databases and timeline analysis.
- Faraday Shielded Enclosure: To maintain RF isolation during the extraction process.

### III. ANALYSIS METHODOLOGY

---

1. RF Isolation: The device was transferred from the portable Faraday bag to a permanent shielded lab enclosure to ensure no remote signal (wipe command) could reach the device.

Ð

2. Advanced Logical Extraction: Due to the iPhone's hardware encryption, an "Advanced Logical" extraction was performed to pull all accessible SQLite databases (Messages, Calls, Apps).

Ð

3. Media Carving: Automated tools were used to "carve" through the unallocated space to recover thumbnails of deleted images.

Ð

4. Verification: The resulting .ufdr report file was hashed and the value was automatically sent to the ForenChain smart contract.

### IV. OBSERVATIONS & LOGS

---

- Encrypted Communication: Found an installed "Signal" messaging app. While the app was locked, notification logs recovered from the system file show a message received on 2026-03-22 stating: "The hardware is in the trunk of the silver sedan."

Ð

- Geofencing Data: Apple Maps "Significant Locations" cache shows the device was at the Batu Kawan Industrial Park area four times between March 15th and March 20th.Đ

Đ

- Deleted Media: Recovered a deleted screenshot of a bank transfer confirmation for RM 15,000 to an offshore account. The screenshot was deleted 5 minutes before the "Airplane Mode" was activated.

## V. FINAL DETERMINATION

The forensic examination of FC-2026-005M provides objective evidence of coordinated activity. The recovered notification logs and geofencing data directly link the suspect to the primary crime scene locations. The attempted destruction of the bank transfer screenshot suggests 'Guilty Knowledge' and intent to conceal financial trails. All extracted data has been verified for integrity, and the forensic image is now archived in the secure evidence vault. Investigation Status: Evidence Highly Relevant.
